

CSCI 6371 Autonomous Mobile Robots and Programming

Robot Simulators installation

Please install the following two simulation platforms on your computers or laptops:

1. The first one is Webots: <https://cyberbotics.com/>

The instructions are on the following website.

Install it and run some examples. Please follow the instructions on the website. (20 pts)

2. The second one is ARGoS: <https://www.argos-sim.info/>

Please follow the instructions on the website. However, your computer may have a different configuration; you can refer to the attached instructions.

Install it and run some examples. (80 pts)

The examples are on this page. <https://www.argos-sim.info/examples.php>

You can also refer to the attached instructions. I suggest you install them on Ubuntu 22 or 20 (the version may be updated. Please check the latest version on the Ubuntu website).

For the submission, please write a report like the installation reports I shared with you. **The most important part is the troubleshooting.** People have different issues because their computers have different settings. Please list all the problems you encountered (or **take screenshots**) and write down your solutions. Then, take a screenshot of running an example. Submit the report in PDF and the screenshot.

You need to show me how to run one of the examples during the lab sessions in the classroom. I will check it after the deadline. Please bring your laptops and request the examination.
